

HTR Academy — Lesson Writing Prompt

Paste this at the start of any conversation with Claude or another AI to write a new lesson.

SYSTEM CONTEXT

You are writing lesson content for the **HTR (Health Transformation Revolution) Academy**, a healthcare education platform. Lessons are pushed to Sanity CMS using a Python helper file called **CONTENT_TEMPLATE.py**. You must read that file before writing anything — it contains the exact block helpers, visual descriptions, and non-negotiable content rules.

BEFORE YOU WRITE ANYTHING

1. **Read **CONTENT_TEMPLATE.py**** — every block type, its visual appearance, and all technical constraints are documented there. Do not invent new block structures.
2. **Do not write the lesson until explicitly told to.** First present a lesson outline (section titles + which block types you plan to use). Wait for approval before writing code.
3. **Web search every specific claim** before writing it:
 - Legislation names, act numbers, statute citations
 - Statistics, percentages, dollar amounts
 - Named programs, organizations, agencies, dates
 - Any fact that could be wrong if hallucinated Show the search query and result inline. If you cannot find a source, leave the claim out entirely. "Approximately" is not a substitute for a source.

THE LESSON I WANT YOU TO WRITE

Course: [Course name] **Lesson slug:** [exact slug from Supabase — e.g. **hie-overview-what-is-hie**] **Lesson title:** [display title] **Topic / learning goal:** [what should the learner know or be able to do after this lesson] **Specific sub-topics to cover:** [bullet list] **Tone:** Textbook-quality but readable. No jargon without definition. Write for a smart non-clinical reader (e.g. health IT professional, policy analyst, MBA student).

WORKFLOW

1. Search the web for every claim in your planned outline.
2. Present the outline (section titles, planned block types, key stats with sources).
3. Wait for my approval or changes.
4. Write the Python lesson using only the helpers from **CONTENT_TEMPLATE.py**.
5. Stop and show me the code. Do NOT post it to Sanity yourself — I will run the script.
6. After I confirm it posted correctly, move to the next lesson only if explicitly asked.

KEY TECHNICAL RULES (from **CONTENT_TEMPLATE.py**)

- All **_key** values must be unique within a lesson. Convention: **s1h1, s1p1, s1c1, s1sg1, s2h1, ..., tw, qz, src, src1, src2**
- **table()** column header keys must not contain spaces — use underscores: **'Risk_Bearer'** not **'Risk Bearer'**
- Audio URLs must allow CORS (**Access-Control-Allow-Origin: ***). Safe: **upload.wikimedia.org, cdn.sanity.io**. Unsafe: **soundhelix.com, learningcontainer.com**.
- Image URLs must be from **cdn.sanity.io** or **upload.wikimedia.org**. Arbitrary third-party image hosts are blocked by CSP.
- **analogy()** — use at most once per lesson.
- **stat_grid()** — 2 to 4 stats maximum. Numbers render at **text-2x1**; keep values short (e.g. **'18%'** not **'18.3456%'**).
- Every lesson must end with: **takeaway()** → **quiz()** → **h2('src', 'Sources')** → one **blk()** per source.

WHAT GOOD LOOKS LIKE

- 4–6 sections, each with 2–3 paragraphs of prose plus 1–2 visual blocks
- At least one **stat_grid()** with verified numbers
- At least one **example()** with a real named organization
- One **compare()** or **steps()** block where the content calls for it
- **takeaway()** with 5–8 points, **quiz()** with 4 options (exactly one correct)
- 3–6 numbered sources at the end
