

Book workflow — read this first

One command: `./book.sh`

The 30-second version

You edit the book in Google Docs. When you download it, run `./book.sh` from this folder. It figures out what to do.

```
cd /Users/baba/Vermont-Health-Platform
./book.sh
```

Why there are two files

File	What it is	Who touches it
HTR_Book_v42.docx	The book. What you read, edit, and export to PDF.	You
HTR_Book_v42.md	Plain text the build reads to regenerate the .docx with all its styling — banners, callout boxes, page numbers, figure captions, the navy palette.	Claude / the build

The styling is *generated*, not hand-made. That is why the .md exists. When you edit the .docx directly, your changes have to be folded back into the .md before the next rebuild, or the rebuild would overwrite them.

`./book.sh` will not let that happen. If it sees edits that are not yet in the manuscript, it stops and says so.

The three commands

```
./book.sh          # normal use: check for your edits, then rebuild + commit
./book.sh build    # just rebuild (no Google Docs edits to pull in)
./book.sh check    # only show what changed in a download; build nothing
```

Plus the handoff commands, so only one of us edits at a time:

```
./book.sh who      # who holds the book right now
./book.sh mine     # you take it — Claude will not edit the manuscript
./book.sh claudie  # hand it over — don't edit in Google Docs until it's back
```

Section titles must stay identical across chapters

Every chapter ends with the same set of sections. **Write the heading exactly the same way each time** — the build styles them by matching the text, so a variant title renders differently and looks broken:

Section	Write it exactly as
Platform guide	<code>## **Work This Chapter on the Platform**</code>
Reader guidance	<code>## **Implications for You**</code>
Glossary	<code>## **Key Concepts in This Chapter**</code>
Citations	<code>Sources: ...</code> — a normal paragraph, not a heading

Sources is the odd one out on purpose: it's a small grey italic footer with a thin rule above it, not a section heading, so it must be a plain paragraph beginning Sources: .

This drifted once already (2026-07-27): the glossary had been written five different ways across chapters — *Key Concepts*, *Key Concepts in This*

Chapter, Key Concepts Introduced in This Chapter, Key Concepts Introduced or Expanded in This Chapter — at two different heading levels, and three chapters wrote `## **Sources**` as a heading while the other fifteen used the paragraph form. To check they're still uniform:

```
grep -nE "^#{1,4}.*Key Concepts" HTR_Book_v42.md # every hit should read the same
grep -cE "^#{1,4} \.*Sources\.*" HTR_Book_v42.md # must be 0
```

After editing in Google Docs

1. **File → Download → Microsoft Word (.docx)**
2. Move it to `/Users/baba/Vermont-Health-Platform/`, replacing `HTR_Book_v42.docx`
3. Run `./book.sh`

It will print a list like:

14 reworded paragraph(s), 13 structural change(s), 116 formatting-only ignored.

1. `-['break'] +['brake']`
...premiums that Vermont families were paying, with no regulatory break.
→ ...premiums that Vermont families were paying, with no regulatory brake.

Those edits are **in the .docx but not yet in the manuscript**. The script stops there on purpose. Paste that list to Claude and say "fold these into the manuscript", or edit `HTR_Book_v42.md` yourself.

Then: `./book.sh build`

Getting a PDF

Google Docs is fine for this — the visual formatting (shading, borders, callout colours, navy headings) survives the round-trip. Google Docs drops only the invisible *style names*, which affects tooling, not appearance.

1. Upload the current `HTR_Book_v42.docx` to Google Docs
2. **File → Download → PDF**
3. Put it in this folder as `HTR_Book_v42.pdf`

 **Export from a fresh upload of the current file.** On 2026-07-27 a PDF was exported from an old Google Docs copy and was missing a full day of work. If the PDF is right, searching it for Figure 1.A characterizes will hit.

Nothing can be lost

- Every Google Docs download is snapshotted to `book-archive/` before anything runs.
 - Both `HTR_Book_v42.docx` and `HTR_Book_v42.md` are committed to git on every build. To see history: `git log -- HTR_Book_v42.docx`
 - To recover the version before the last build:
`git checkout HEAD~1 -- HTR_Book_v42.docx`
-

Version bumps (v43, v44 ...)

Bump for structural change — chapters added/removed/renumbered, a new appendix, or when you have shared v42 and want a clean break. Not for typos; git already tracks those.

To bump, ask Claude, or:

```
cp HTR_Book_v42.md HTR_Book_v43.md
cp HTR_Book_v42.docx HTR_Book_v43.docx
```

then in .gitignore change !HTR_Book_v42.docx -> !HTR_Book_v43.docx
and in book.sh change the MD= and DOCX= lines at the top

Audio narration

Transcripts regenerate from the manuscript; the audio is rendered locally and free (no API, no cost):

```
python3 book-build/make_transcripts.py          # .txt from the manuscript
./scripts/generate-narration-audio.sh          # macOS `say` → .m4a, all
./scripts/generate-narration-audio.sh 02-chapter-01 # just one chapter
./scripts/generate-narration-piper.sh          # Piper, more natural voice
```

As of 2026-07-27 the recorded audio is from June 14 and is stale in the preface, introduction and chapter 1 (88% of the drift). Re-record those three when the manuscript settles.
