

Chapter 1 — exact replacements (proposed, NOT applied)

Nothing here has been applied to [HTR_Book_v42.docx](#). Each item is: where it is, the text that is there now, and the text that would replace it. Evidence for every item is at the bottom, separate from the text.

Rules I followed: the chapter yields to the Introduction (it says Vermont withdrew from AHEAD in July 2026; expected EAST Fund ≈ \$138M, cut to a cap near \$10M). Where the Introduction already states a fact, the chapter points to it. Every promise is reworded to what the platform code actually does — nothing new is claimed.

GOES IN THE BOOK

A. Facts that are stale after Vermont's July 2026 AHEAD withdrawal

A1 — §1.3, the "Vermont application" line under Policy

- Now: Vermont application: Acts 167 and 68, the AHEAD Model State Agreement, and the Statewide Strategic Plan mandate are Vermont’s Policy pillar interventions. Each converts voluntary reform into statutory obligation.
- Replace with: Vermont application: Acts 167 and 68 and the Statewide Strategic Plan mandate are Vermont’s Policy pillar interventions. Each converts voluntary reform into statutory obligation.

A2 — Figure 1.5 (§1.7), Policy row, second column

- Now: ...the legislative reform cascade; AHEAD Model State Agreement (January 2025)
- Replace the end with: ...the legislative reform cascade; AHEAD Model State Agreement (January 2025; withdrawn July 2026)

A3 — Figure 1.5 (§1.7), Economics row, second column

- Now: Reference-based pricing (mandatory, FY2027); global hospital budgets (FY2028–2030); AHEAD total cost of care accountability
- Replace with: Reference-based pricing (mandatory, FY2027); global hospital budgets (FY2028–2030)

A4 — §1.10.3, third sentence

- Now: ...while designing the AHEAD global budget methodology in parallel...
- Replace with: ...while designing the Act 68 global budget methodology in parallel...

A5 — §1.11.1, fourth and fifth sentences (one paragraph, "Vermont’s legislative progression illustrates both...")

- Now: The AHEAD Model federal agreement layered in the federal funding that made the technology build financially feasible. The Rural Health Transformation award – \$195 million for Vermont in its first year, with comparable annual awards expected through FY2030 – is a Policy-pillar outcome, not an Economics-pillar outcome.
- Replace with: The AHEAD Model federal agreement was to add federal funding for the technology build; Vermont withdrew from it in July 2026, as the Introduction explains. The Rural Health Transformation award – \$195 million for Vermont in its first year (federal fiscal 2026) – is a Policy-pillar outcome, not an Economics-pillar outcome.

A6 — Figure 1.6 (§1.11.5 table), Stage 1 row, last column

- Now: Acts 167, 51, 68; AHEAD State Agreement; \$195M/yr RHT award
- Replace with: Acts 167, 51, 68; \$195M first-year RHT award

A7 — Figure 1.6 (§1.11.5 table), Stage 3 row, last column

- Now: Global hospital budgets; RBP at ≤200% Medicare; EAST Fund up to \$150M annually
- Replace with: Global hospital budgets; RBP at ≤200% Medicare; EAST Fund (roughly \$138M expected; cut to a cap near \$10M when Vermont withdrew from AHEAD)

A8 — §1.14.1, third sentence of the paragraph "This is a manageable but costly risk..."

- Now: ...it delays the financial management capability for AHEAD, the equity measurement capability...

- Replace with: ...it delays the financial management capability for Act 68 global budgets, the equity measurement capability...

A9 — §1.17, "If you are a Vermont hospital executive"

- Now: ...prevents the "Managing Blind" failure mode in your first AHEAD performance year.
- Replace with: ...prevents the "Managing Blind" failure mode in your first Act 68 global budget performance year.

A10 — §1.17, "If you are a Vermont legislator", third question

- Now: Is the RHRC engagement building hospital-level Operations capacity ahead of AHEAD's clinical accountability requirements?
- Replace with: Is the RHRC engagement building hospital-level Operations capacity ahead of Act 68's global budget accountability requirements?

A11 — §1.18, Key Concepts, "Transformation capital vs. incentive architecture"

- Now: Transformation capital (RHT award, EAST Fund) is time-limited bridge funding for infrastructure.
- Replace with: Transformation capital (the RHT award, and the EAST Fund until Vermont's withdrawal from AHEAD) is time-limited bridge funding for infrastructure.

B. Promises the platform does not keep — reworded to what it does

B1 — §1.3 platform box, row "Diagnostic"

- Now: The HTR Simulator (healthtransformationreview.org/htr-simulator) scores an initiative or a state across the five pillars, applies the Equity Imperative as a justice check, and shows where the sequence breaks.
- Replace with: The HTR Simulator (healthtransformationreview.org/htr-simulator) models the impact of a set of transformation choices across the five pillars and holds each result to the Equity Imperative.

B2 — §1.12.3, the "TRY THIS" box (keep the bold "TRY THIS —" lead-in formatting)

- Now: TRY THIS – Test a critical-path violation. Open the HTR Simulator and model an organization that funds a downstream pillar before its upstream gate is open – for example, high Economics ambition with a weak Technology score. Watch the composite readiness collapse. Then open the Transformation Friction Index to see which pillar is your binding constraint. The principle is simpler to feel in the tool than to argue on the page: no amount of downstream funding opens an upstream gate. Spending more on the payment model does not make the missing analytics appear.
- Replace with: TRY THIS – Find the pillar that will stall your sequence. Open the Transformation Scorecard (healthtransformationreview.org/research-lab/knowledge-workspace?tab=scorecard) and score your organization on all five pillars. It returns your weakest pillar. Then read Figure 1.6: every pillar downstream of that one will stall until it is fixed. The principle is simpler to feel in the tool than to argue on the page: no amount of downstream funding opens an upstream gate. Spending more on the payment model does not make the missing analytics appear.

B3 — §1.15, the paragraph before Figure 1.9

- Now: The execution-sequence argument is best understood by manipulating it, not just reading it. The HTR platform turns this chapter's three core claims – that the pillars are interdependent, that order is non-negotiable, and that getting the order wrong produces a measurable failure cascade – into tools you can run against your own organization or state.
- Replace with: The execution-sequence argument is best understood by manipulating it, not just reading it. The HTR platform turns this chapter's argument into tools you can run: one that shows the nine dependencies, one that scores your own organization pillar by pillar, and two that model what a transformation does to each pillar.

B4 — Figure 1.9, HTR Simulator row (all three cells)

- Now: Score a real organization or state across all five pillars and watch the composite readiness number respond | HTR Simulator | Drop one pillar's score to zero and observe the cascade – the simulator penalizes downstream readiness, reproducing the OneCare logic in Figure 1.1.

- Replace with: **Model** a set of transformation choices and see their projected impact on each of the five pillars | **HTR Simulator** | Choose recommendations and watch the pillar scores and the equity result change.

B5 — Figure 1.9, Transformation Friction Index row (all three cells)

- Now: **Quantify** where reform is losing momentum and which pillar is the binding constraint | **Transformation Friction Index** | Identify your own “Technology gate” bottleneck – the chapter’s central Vermont vulnerability – before it becomes a financial one.
- Replace with: **Understand** what makes a reform hard to carry out, pillar by pillar | **Transformation Friction Index** | See the inputs each pillar’s friction is scored on – for Technology, the EHR gap, interoperability requirements, the number of new platforms and the IT implementation timeline – and how the composite score is read.

B6 — Figure 1.9, Impact Simulation row (all three cells)

- Now: **Model** how one pillar’s shortfall propagates through the other four over time | **Impact Simulation** – /impact-simulation | The lag: a Technology gap shows up in Economics results a year later, which is why it is missed.
- Replace with: **See** how one transformation scenario lands on all five pillars at once | **Impact Simulation** – /impact-simulation | Pick a scenario, adjust its parameters, and see the impact on each pillar, whether it passes the Equity Imperative, and which binding constraints it triggers.

B7 — §1.15, the "TRY THIS — Reproduce the OneCare cascade" box (keep the bold lead-in formatting)

- Now: **TRY THIS – Reproduce the OneCare cascade.** Open the HTR Simulator and build a profile with strong Economics ambition (high) but weak Policy mandate (voluntary) and weak Technology substrate (no integrated real-time data). The composite score should collapse – not because the Economics inputs are bad, but because the simulator enforces the same dependency logic that sank OneCare. Then fix the order: raise Policy and Technology first, and watch the same Economics inputs finally produce a viable score. That reversal is the argument of this chapter.
- Replace with: **TRY THIS – Look for the OneCare pattern in your own organization.** Open the Transformation Scorecard and score your organization on all five pillars. If a downstream pillar scores higher than an upstream one – strong Economics on a weak Policy and Technology foundation – you have the pattern that sank OneCare. Fix the order: raise the upstream pillars first. That reversal is the argument of this chapter.

NOT part of the text — evidence and notes

Sources for A5–A7 (checked 2026-09-21):

- RHT: Vermont's own program page (healthcarereform.vermont.gov/hr1rural-health-transformation-fund): "Vermont's Year 1 (Federal Fiscal year 2026) award is \$195 million" (\$195,053,740.44). The page gives no amount for FY2027–2030. One news summary (WCAX) says "\$195 million a year for five years"; I found no primary source for that. Chapters 2, 6, 11, 14, 15 and Appendices E and G say "per year for five years / about \$1 billion" — that is NOT supported by the state's page.
- EAST: Vermont Public (2026-07-28) quotes the Human Services Secretary: officials calculated "an extra \$138 million"; after renegotiation payments were "capped at \$10 million". I did not find a primary source for "\$150M" (used in Chapters 1, 2, 6, 15, 16 and the Conclusion). It may be the agreement's stated maximum; I could not confirm.

Code evidence for B1–B7: no file under **app/** or **components/** or **lib/** implements upstream/downstream or gate-penalty logic. **/htr-simulator** is an overview page; the four simulators it links to score policy scenarios. **/transformation-friction-index** is a static explainer with no inputs or calculator. **/impact-simulation** shows a scenario's effect on all five pillars at once and flags binding constraints; it has no lag or time-propagation. The Transformation Scorecard computes and displays the weakest pillar (**TransformationScorecard.tsx**).

Not changed on purpose: the Introduction (yours); Chapters 2–16 (37 stale AHEAD sentences listed in **stale_facts_sweep.md**); the "Go Deeper" boxes missing from Chapters 2–16.

Decision that is yours, not covered above: whether the platform should *gain* the gate/penalty behaviour (so the book's original promises become true) instead of the book being reworted. B1–B7 assume the book is reworted, because that needs no platform build and cannot make the book wrong.
