

The Six-Pillar Execution Sequence

Revised sequence: Policy → Technology → Economics → Clinical → Equity → Operations

Vermont Evidence & OneCare Sequencing Failures

Vermont anchors show what correct sequencing achieves. OneCare failures show what happens when foundational stages are skipped.

Stage 1 — Policy: Optional participation — no policy foundation to enforce accountability. High-cost providers opted out, leaving OneCare unable to control total cost.

Stage 2 — Technology: No integrated, real-time clinical and claims data. Care managers worked from data 60–90 days old — the 'Managing Blind' failure mode.

Stage 3 — Economics: Payment model launched before technology substrate was ready. Economics-as-management attempted while managing blind — producing unexpected financial losses.
