

Health Transformation Review — Coach & Instructor Guide

For Academy faculty, coaches, and learning designers who create and deliver educational content on the HTR platform.

Your Role on the Platform

Coaches and instructors on HTR have two primary responsibilities:

1. **Content creation** — designing modules, courses, and case studies in Sanity Studio
2. **Learner guidance** — structuring learning tracks so learners progress from foundational to advanced content

HTR Academy is aimed at healthcare professionals learning health transformation frameworks. Your content should assume a working knowledge of healthcare delivery but not necessarily of economics, policy, or systems reform.

Accessing the Studio

Log into the Sanity Studio at <https://your-domain.com/studio> (or <http://localhost:3000/studio> for local development).

You need a Sanity account with editor or administrator access to the `fxz10x17` project.

Designing a Course

A course is a sequence of academy modules organized around a single learning theme. The overall structure is:

There is a `course` document type in Sanity for course-level metadata. Individual modules are connected by:

- Setting `courseTitle` to the same string across all modules
- Setting `moduleNumber` (1, 2, 3...) and `totalModules` on each module
- Setting `prevModuleSlug` and `nextModuleSlug` on each module so learners can navigate forward and back

Step-by-step: Creating a new course

Step 1: Plan the structure

Before opening the Studio, map out:

- Course title and one-sentence description
- Which pillar it belongs to
- Target level: Foundational, Intermediate, or Advanced
- Module list with working titles and estimated read times
- Learning objectives for each module (3–5 per module, action-oriented)

Step 2: Create the course document

1. In the Studio sidebar, go to Courses
2. Click New Course

- 3. Fill in the course title, description, pillar, level, and any other metadata
- 4. Publish the course document

Step 3: Create each module

For each module in sequence:

- 1. Go to Academy Module in the sidebar
- 2. Click New
- 3. Set `courseTitle` to the exact same string as your course title
- 4. Set `moduleNumber` (e.g., 1)
- 5. Set `totalModules` (e.g., 5 for a five-module course)
- 6. Set `pillar` and `level` consistent with the course
- 7. Set `estimatedReadTime`
- 8. Write `learningObjectives` — each one starts with an action verb ("Analyze...", "Evaluate...", "Apply...")
- 9. Write a 3–4 sentence `summary` — this appears on the module listing page
- 10. Write the full `body` content
- 11. Leave `prevModuleSlug` and `nextModuleSlug` blank for now
- 12. Publish the module
- 13. Note the auto-generated slug (it will appear in the slug field)

Repeat for all modules.

Step 4: Wire up the navigation

Once all modules are published:

- 1. Open Module 1 → set `nextModuleSlug` to Module 2's slug → publish
- 2. Open Module 2 → set `prevModuleSlug` to Module 1's slug, `nextModuleSlug` to Module 3's slug → publish
- 3. Continue through the sequence
- 4. The last module should have `prevModuleSlug` set but no `nextModuleSlug`

Step 5: Verify

Go to `/academy/modules/[first-module-slug]` on the site and check that:

- The module number and total display correctly ("Module 1 of 5")
- The Next button appears and leads to Module 2
- Module 2 has a Previous button back to Module 1

Writing Effective Module Content

Structure

A well-structured module follows this pattern:

- 1. **Opening** (2–3 paragraphs) — what this module covers, why it matters, what the learner will gain
- 2. **Core content** (organized by H2 sections) — the main instructional content
- 3. **Examples and case studies** — concrete applications of the concepts
- 4. **Key takeaways** (bullet list or H2 section) — what to remember
- 5. **Next steps** (final paragraph) — bridge to the next module

For the AI Knowledge Base

The AI Analyst reads your module content. Writing clearly and specifically helps the AI answer questions more accurately:

- Name concepts precisely (use exact terminology like "Alternative Payment Model" not "APM" on first use)
- Include specific data points, program names, and policy references
- Use the same terminology consistently across modules in a series

- Learning objectives are indexed separately — write them in full sentences ("Analyze the financial structure of a capitated payment model")

Content depth by level

Foundational: Define terms. Explain the "what" and "why." No prior knowledge of the topic assumed.

Intermediate: Go beyond definitions. Explain tradeoffs, mechanisms, and implementation considerations.

Advanced: Tackle complexity, edge cases, multi-stakeholder dynamics, and strategic decision-making frameworks.

Writing Case Studies

Case studies appear in [/academy/case-studies](#) and are indexed by the AI Analyst.

A case study should:

- Be based on a real organization or program (named specifically where public)
- Follow a clear problem → approach → outcome structure
- Include specific metrics where available (e.g., "reduced ED utilization by 18% over 24 months")
- Connect explicitly to one or more of the five pillars
- End with lessons learned or transferable insights

Set [pillar](#) and [summary](#) carefully — these are what learners see before clicking through.

Webinars and Events

When scheduling a webinar:

1. Create the [webinar](#) document before the event with [date](#) set to the event time
2. Add a [registrationLink](#) so learners can sign up
3. After the event, update the document — you can leave it live as "On Demand" content by changing the description to indicate it's a recording
4. Add a video link in the description or body if the recording is hosted externally

Webinars are sorted chronologically — upcoming events appear first.

Learning Tracks

Learning tracks ([/academy/tracks](#)) are curated learning paths that guide learners through content in a structured sequence. Tracks typically span multiple courses and content types.

Learning track data may live in [lib/data/learning-tracks-data.ts](#) (static) or in a Supabase table (dynamic). Check with the development team about which is active.

A track typically has:

- A name and description (e.g., "Policy Analyst Track")
- A target audience (e.g., "Healthcare policy professionals entering the field")
- An ordered list of content items (modules, case studies, webinars)
- Recommended time to complete

The Academy Glossary

The glossary at [/academy/glossary](#) is searchable and is also indexed by the AI Analyst.

As a coach, you should add new definitions whenever you introduce a new term in a module. This creates a consistent vocabulary across the platform.

Best practices:

- Define the term in plain language first ("Social Determinants of Health refers to...")
- Include the acronym expansion in the first sentence
- Keep it under 150 words
- Tag all relevant pillars (a SDOH definition should be tagged Equity AND Policy AND Clinical)
- After adding new definitions, ask the technical team to trigger a RAG re-index

The AI Analyst and Your Content

The AI Analyst (available at [/chat](#) and in the right sidebar) can answer questions based on content you publish. After you publish significant new content, the technical team should trigger a re-index ([POST /api/ingest](#)) to bring your content into the AI's knowledge base.

What helps the AI answer well:

- **Specific titles and proper nouns** — the AI cites document titles explicitly ("According to the Value-Based Care Fundamentals module...")
- **Clear structure** — H2 headings help the AI understand what each section covers
- **Concrete data** — specific statistics are more useful to the AI than vague generalizations
- **Consistent terminology** — if you call something "AHEAD Model" in one module, don't call it "All-Payer Claims Database model" in another

Pillar and Level Consistency

When publishing content, use pillar and level values consistently:

Pillar values (exact strings, case-sensitive):

- [Policy](#)
- [Economics](#)
- [Technology](#)
- [Clinical](#)
- [Equity](#)

Level values:

- [Foundational](#)
- [Intermediate](#)
- [Advanced](#)

Impact levels (for policy analysis articles):

- [Critical](#)
- [High](#)
- [Medium](#)

Managing Active Analyst Notes (The Signal)

Analyst Notes appear in the left sidebar on all pages. These are short editorial notes attributed to a named analyst.

As a coach or subject matter expert, you may be asked to contribute Signal notes.

Guidelines:

- Maximum two active at a time
- Keep to 2–3 sentences
- Write for a senior executive audience — skip basic definitions
- Lead with the finding, not the background
- Bold 1–2 key phrases

- Keep the headline under 50 characters
 - When a note is no longer current, uncheck "Is Active?" to hide it (do not delete)
-

Checking Your Work

Before publishing any content:

- Preview the content in Sanity Studio using the Preview button (if configured)
- Verify the slug is clean and descriptive (edit it if the auto-generated version is awkward)
- Confirm the pillar and level are set correctly
- Read the summary — this is what learners see before clicking through
- For modules, verify `courseTitle`, `moduleNumber`, and `totalModules` match the rest of the series
- For webinars, confirm the `date` field is set to the correct datetime

After publishing:

- Navigate to the URL on the live site to confirm it appears correctly
 - For new modules in a series, test the prev/next navigation
 - For new glossary terms, do a search on `/academy/glossary` to confirm it appears
 - Notify the technical team if you want new content added to the AI knowledge base
-

Questions and Support

For content-related questions: contact the editorial team or chief editor.

For technical issues (content not appearing on the site, Studio access problems): contact the development team.

For AI Analyst questions (content not showing up in AI responses after re-indexing): contact the development team and reference this guide's AI section.
