

Sanity Content Ecosystem Plan — Pillars, Courses, Analysis & Book Tie-In

Source of truth: queried live from Sanity project `fxz10x17` / dataset `production` + Supabase `courses/tracks/lessons`, on 2026-06-02. **Approved decisions:** keep `policyAnalysis` as a complementary "Analysis" layer · delete redundant legacy `academyModules` after review · full bidirectional book tie-in (`courses + analysis` → `chapters`).

0. EXECUTION LOG — Phase 0 COMPLETE (2026-06-02)

The deep audit **overturned the initial "108 legacy modules to delete" assumption** and uncovered a live bug. What was actually done:

1. **Backup:** all 403 `academyModule` + `policyAnalysis` docs (full bodies) → `/sanity-backups/backup-academy-policy-*.json`. Every mutation below is reversible.
2. **Discovered the real model:** `courses` (Supabase) → `tracks` (`course_id`) → `lessons` (`track_id`); lesson body lives in Sanity, linked by `lessons.sanity_slug = Sanity._id`. Pillar already propagates through `courses`→`tracks`→`lessons`. The interop course alone has **25 linked lessons**, not 7 — the title-matcher had mislabeled live lessons as "legacy."
3. **LIVE BUG FOUND & FIXED:** 25 Supabase lessons had a `sanity_slug` pointing at a **non-existent** Sanity doc (stale `vbc-*/precision-medicine-*` prefixes) → they were rendering thin/empty content. Retargeted each to its correct existing doc via `scripts/fix-broken-sanity-links.mjs`. **Broken links: 25 → 0**. Also fixed a collision where two distinct lessons (`aco-basics`, `vbc-module-3`) shared one `sanity_slug`.
4. **Deleted 36 genuinely-redundant academyModules** (`scripts/delete-redundant-academy-modules.mjs`): thin (<800w) legacy modules whose topic is owned by a richer live lesson, or exact-title twins. Each verified **not referenced by any live lesson** at run time. `academyModule 289` → **253**, 0 broken links after.
 - The safety net **blocked 8 deletes** that the relink had just turned back into live content — these would have been destroyed under the original plan.
5. **`policyAnalysis` cleaned** (`scripts/clean-policy-analysis.mjs`): normalized 5 non-canonical pillars (`CLINICAL/EQUITY/TECHNOLOGY/Science/Innovation` → canonical); deleted `debug-video-test`, the 269-char `the-triple-threat-v2` stub, and 3 draft-shadow docs that had a published twin. **114** → **109**, 0 non-canonical pillars remain. (`drafts.strategic-implementation-rpm...` left intact — no published twin.)
6. **Resolved the 7 rich orphans** (2026-06-02): on inspection, 2 were already linked (`vbc-hedis-ecqm`, `global-budgets-hospital-finance`); 4 (`vbc-future`, `-pop-health`, `-risk-hcc`, `-global-budgets`) were **older superseded twins** of already-linked purpose-written lessons (`vbc-future-directions`, `aco-population-health-strategy`, `risk-adjustment-hcc`, `global-budgets-hospital-finance`) → deleted. 1 was a real mislink: the `fee-for-service-origins` lesson pointed at `vbc-fundamentals-m1` (rendering identical content to the `vbc-fundamentals-m1` lesson) → retargeted to its namesake `fee-for-service-origins` doc. `academyModule 253` → **249**, 0 broken links.

Still open:

- Phase 1 (`chapterRef` + UI wiring) below.
-

1. The spine already exists

`frontend/lib/taxonomy/` is the canonical backbone and is good:

- **pillars.ts** — the **6 pillars**: Policy, Economics, Technology, Clinical, Equity, Operations (single source of truth for identity/color/routing).
- **chapters.ts** — all **20 book chapters** grouped by pillar (**Policy Pillar, Technology Pillar**, ...) with **pillar + platformLinks**. **The book is the pillar framework.**
- **tools.ts, programs.ts** — platform tools/programs already linked from chapters.

The fix is **not** to rebuild taxonomy. It is to (a) clean the two orphan libraries, (b) give every content type the same **pillar** + new **chapterRef** keys, and (c) surface those relationships in the UI so the ecosystem reads as one thing.

2. Content inventory (live)

Type	Count	Role	Pillar today	Action class
academyModule (live, lesson-linked)	253	Lessons (validated)	via course→track→lesson	KEEP, tie to book
academyModule (redundant legacy)	36	superseded	—	✅ DELETED (Phase 0)
policyAnalysis	109	Analysis/briefs (mostly opinion)	✅ normalized	KEEP as Analysis layer
Supabase courses	15	Course shells	13/15 set	backfill 2 nulls; add chapter_ref
hospital	155	Dashboard data	—	LEAVE (verify dashboard wiring)
statePerformanceIndex / rhsState	50 / 50	Dashboard data	—	LEAVE
definition	36	Glossary	—	add pillar
caseStudy / report / webinar / analystNote / instructor	7/4/4/5/4	Supporting editorial	mostly none	add pillar + chapterRef

3. Target ecosystem model (per pillar)

Pillar → **Book chapter(s)** [theory] → **Course(s)** [learn] → **Analysis briefs** [current take] → **Tools/Programs** [do]

Every content item carries two shared keys so all surfaces cross-reference:

- **pillar** — one of the 6 canonical ids.
- **chapterRef** — book chapter "1"–"20" (NEW, optional). The book tie-in.

4. policyAnalysis cleanup — pillar normalization + dedupe

4a. Pillar casing/off-model fixes (5 docs)

_id	current pillar	→ set to
clinical-rpm-rural-primary-care	CLINICAL	clinical

_id	current pillar	→ set to
equity-broadband-digital-determinants	EQUITY	equity
tech-vhie-data-liquidity-fabric	TECHNOLOGY	technology
alzheimers-drug-pipeline-costs	Science	clinical
optimizing-care-maximizing-health-manifesto	Innovation	economics (manifesto — confirm)

4b. Duplicate / draft / junk deletes (policyAnalysis)

drafts.* are unpublished drafts shadowing a published twin → safe delete.

- **DELETE** debug-video-test (DEBUG test doc)
- **DELETE** hospital-services-optimization-vermont-act-167-deep-dive (exact dup of the non-deep-dive)
- **DELETE** drafts.technical-deflation-vermont-policy-2026-croftc1 (draft twin of published)
- **DELETE** drafts.precision-medicine-clinical-scaling (draft twin of precision-medicine-clinical-scaling)
- **DELETE** drafts.strategic-implementation-rpm-vermont-rural-health, drafts.uninhabitable-math-vermont-healthcare-cliff (draft twins)
- **Triple Threat cluster (3)** → keep 1, delete the-triple-threat-v2 + merge/redirect triad-of-transformation-us-healthcare (confirm which is canonical)
- **VHIE cluster (7)** → these are NOT all dupes; several are genuinely different angles (resilience, CRISP pivot, liquidity fabric, evolution). REVIEW per-doc before cutting — recommend keep 3–4, delete near-twins.

5. Legacy academyModule disposition — ⚠ SUPERSEDED by §0 log

This section is the **ORIGINAL** title-based guess and is kept only for history. It was wrong: many "orphans" were live lessons behind broken links (now fixed), and the real safe-delete set was **36**, not 108. The authoritative outcome is the §0 Execution Log. Do not act on the verdicts below.

Verdict legend: DELETE (exact dup) = identical title to a new validated lesson · DELETE (covered) = topic owned by a new lesson · REVIEW = title-match weak; **verify the new course actually covers it before deleting** (these are where unique content could be lost).

⚠ **Risk flag:** the **interop-*** orphans (FHIR, HL7v2, SMART-on-FHIR, info-blocking, MPI, de-identification, interface engines) mostly show as REVIEW. The new **healthcare-interoperability** course has only 7 lessons — it may **not** fully cover these ~18 interop modules. Recommend: before deleting any **interop-*/hie-*** REVIEW doc, confirm coverage or fold the unique ones into the interoperability course.

Legacy delete summary

- **DELETE now (high confidence):** all 16 in "Value-Based Care: From Fee-for-Service to Outcomes" + the exact-dups in "VBC Fundamentals" + "Block Type Test" doc + the ***-covered** HIE/SDOH/quality dups. ≈ 45–55 docs.
- **REVIEW before delete:** the **interop-*** set, the **aiml-*** originals (verify the new AI course covers metrics/FDA/ethics/governance), precision-medicine M1–M6 (new genomics course is broader but check the 6 specific angles). ≈ 50 docs.
- **Net:** likely delete ~90–100 of 108; keep/fold a handful of interop modules.

6. Book tie-in — course → chapter map (for approval)

Derived from `chapters.ts` pillar groupings. `chapterRef` to set on each course:

Course (Supabase slug)	Pillar	Book chapter(s)
medicaid-101	policy	5
medicare-fundamentals	policy	5
medicaid-managed-care-operations	policy	5
value-based-care	economics	8, 9
hospital-finance	economics	8, 9
ai-machine-learning-healthcare	technology	6, 7
interoperability-data-exchange	technology	6, 7
clinical-quality-measurement	clinical	11
population-health-management	clinical	10, 11
behavioral-health-integration	clinical	10

Course (Supabase slug)	Pillar	Book chapter(s)
genomics-precision-medicine	clinical	7, 10 (confirm)
health-equity-sdoh	equity	12, 13
revenue-cycle-management	operations	14, 15
hie-health-reform-onboarding	(cross-cutting)	16 (Knowledge Transfer)
welcome-htr-framework	(cross-cutting)	1 (Framework)

policyAnalysis → chapter is bulk-assignable by pillar (e.g. all **economics** analyses default-link Ch. 8–9), refined per-doc later.

7. UI wiring (surfacing the relationships)

1. **Pillar pages** (/policy ... /operations): add "Courses in this pillar" rail (query Supabase by **pillar** — data exists) + "Related Analysis" rail (Sanity policyAnalysis by **pillar**).
2. **Book chapter view**: add "Go deeper: Academy course" + "Related briefs" via **chapterRef** (extend existing **platformLinks** pattern in **chapters.ts**).
3. **Course pages** (/academy/tracks/[courseSlug]): "From the Book (Ch. N)" callout + reciprocal "Related analysis".
4. **Courses index**: pillar filter already built (**CoursesClient.tsx**); just fix the 2 null-pillar courses.

8. Other content types

- **definition (36)**: add **pillar**; surface on pillar pages + glossary (filter already exists).
- **caseStudy/report/webinar/analystNote (20)**: add **pillar** + **chapterRef**; appear in pillar rails.
- **hospital/statePerformanceIndex/rhtState (255)**: dashboard data — LEAVE; one task = confirm each is still consumed by its dashboard, archive any truly orphaned.
- **instructor (4)**: reference data for courses — LEAVE.

9. Phasing & order of execution

0. **Cleanup** (after approval of §4b + §5 lists): delete junk/dups + legacy. Read-only verification of interop coverage first.
1. **Normalize** policyAnalysis pillars (§4a).
2. **Schema**: add **chapterRef** to Sanity schemas (policyAnalysis, caseStudy, report, webinar, definition) + **chapter_ref** column to Supabase **courses**. Add **pillar** to definition.
3. **Backfill**: course→chapter (§6); 2 null course pillars; policyAnalysis→chapter by pillar; definition pillars.
4. **UI**: pillar-page rails → book-chapter links → course callouts (§7).
5. **Validation triage**: flag ~30 stat-heavy policyAnalysis docs for spot-check.

10. Open questions for you

1. **Manifesto optimizing-care-maximizing-health-manifesto** — which pillar? (defaulted economics)
2. **Triple Threat / Triad** — which of the 3 is canonical to keep?
3. **VHIE cluster (7)** — want me to produce a per-doc keep/delete recommendation before touching them?
4. *interop- legacy modules** — fold the unique ones into **interoperability-data-exchange** course, or accept the new course's narrower scope and delete?
5. **genomics-precision-medicine** book chapter — Ch. 7 (tech/genomics) or Ch. 10 (clinical)? Book may not have a dedicated genomics chapter.
